

iTrail - first proper use of iPhone gps

August 7, 2008 / Gavin Jackson

apple

google maps

gps

iphone

\$4 Application that makes good use of the iPhones GPS.

- Samples at user defined intervals (minimum delta is 10 seconds)
- Allows you to record multiple "tracks"
- Provides feedback on altitude, speed and distance travelled
- integrates with google maps on the iphone to show where you have been
- outputs tracks to google documents in either kml or gpx formats (that you can load up later using google maps or google earth)
- records even when screen has been locked (and works while ipod music is playing)

This is not a navigation app per se - it does not allow you to specify co-ordinates, it's more of a static recording and analysis utility (that you would use to measure your running and cycling performance).

Still waiting to see a decent geocaching app.
